

PROSTATE CANCER FAMILY TREE

TALK TO LOVED ONES ABOUT THEIR RISK

Family history is a risk factor for prostate cancer. A man with at least one close relative who has had the disease has twice the risk of having prostate cancer compared to the general population. Start a dialogue with your father, son, grandfather, brother, and other male relatives to protect the health of those you love.

Fill out your family tree and then share this information with those you love and your doctor. Learn more about prostate cancer risk factors and download this form at www.zerocancer.org/learn.

Grandfather(s)

Father

Uncle(s)

Brother(s)

YOU!

Cousin(s)

Nephew(s)

Son(s)

Grandson(s)

- **1 in 8** men will be diagnosed with prostate cancer in their lifetime.
- Prostate cancer is the most commonly diagnosed male only cancer in the U.S., and one of the leading cancer killers among men.
- Every **15** minutes another American man dies from prostate cancer. That's a little more than **91** deaths per day and **34,130** this year. That's enough to fill an entire baseball stadium.
- More than **3.1** million men are living with the disease in the U.S.
- If there's a family history of the disease or a similar cancer, or a man is African American or a Veteran, their risk of disease doubles.
- Early detection and advances in treatment are saving lives. When prostate cancer is detected early, the survival rate is **98** percent!
